

Rescue Kit

This new rescue kit is designed for the fall accident rescue you will most likely encounter on a job site or industrial site. The rescue kit can be used by an average strength person as it has a 3:1 mechanical advantage. The rescue takes place with the rescuer remaining at a safe point. The fallen worker is lowered to the ground or raised back up, depending on how the fall has happened, without the rescuer having to descend to the victim. The fallen worker is not required to assist in the process, so unconscious casualties can be rescued.

The kit fills a need in construction and industry to rescue 'common' falls. Most rescue equipment on the market is designed for 'dramatic' high level falls on ski lifts or down mines and needs highly trained very fit professional rescuers to understand and use it. This new 'Gotcha' kit is designed to rescue workers who have fallen when using regular fall arrest equipment. The rescue is carried out by a worker who has received training on the product, who wants to carry out the rescue without abseiling down to the worker, and whose main job is not rescue.

This patented kit is designed so it does not have to be altered, and in fact it cannot be altered. It is ready for use straight from the bag and the rescuer only has to decide whether the victim should be lowered or raised. Rapid action is essential after a fall and this superb kit is your first resort. It should be ready wherever workers are using fall arrest equipment.

Suspension Trauma is the name given to the medical state which a fallen worker experiences when hanging in a harness. Conscious or not, circulation is trapped at pinch points and soon the blood purification cycle is interrupted. The build up of toxins is as dangerous as the lack of circulation and is the reason why a fallen worker cannot sustain suspension for more than 10-20 minutes. Hence the need for a quick rescue. Trauma straps provide relief if the worker is conscious and can use them.

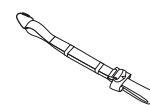

Suspension Trauma Straps

Trauma Straps act as stirrups for a fallen worker to take the weight off the pinch points on his harness and relieve his circulation. They attach to the side of the harness and are opened by the wearer in the event of a fall.
