

# RailGuard

RailGuard is readymade in standard size sections. Gives a regulation strength guardrail immediately without structural or construction work. On a flat roof, the weighted bases hold the RailGuard securely without needing to penetrate the roof surface and can be configured in straight runs or at angles, and with gates which open either way. Indoor installations on smooth concrete can use the same bases with rubber feet attached, or use brackets designed to mount the rails to edges or vertical surfaces, incorporating release pins for removing railings. Rails with longer legs available for pit edges.

- Metal railing system lets you to protect areas on your property where fall risks exist
- Can be configured by maintenance staff without cutting or welding
- Roof penetration not necessary when using stand alone weighted bases
- Base has locking pin with custom tool to protect from unauthorised dismantling of railing
- Hinged gate kits can be incorporated in run to allow access to stairs, skylights and equipment
- Line of mounting brackets makes installation of railings possible in almost any situation
- Ontario engineer approved to OH&S Reg 213.91
- Powder coated safety yellow. Other custom finishes available

Outside Uses: Roof edges, sky lights, roof hatches, roofing HVAC equipment, elevated walkways, excavations and crowd control.

Inside Uses: Loading docks, shipping pits, elevated decks, machine centres, material storage areas, maintenance projects and mezzanines.
